*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

**Background** Skin and soft tissue infections (SSTI) include, but are not limited to, paronychia, cellulitis, erysipelas, folliculitis, impetigo, and abscess. To provide optimal treatment, clinicians must determine the location and severity of infection, then consider pathogens specific to the particular SSTI as well as local antibiotic resistance patterns. If antibiotics are indicated, they should be appropriately narrow and given for the minimal necessary duration to minimize adverse effects including antibiotic resistance. In 2014, the Infectious Diseases Society of America (IDSA) provided guidelines on the diagnosis and management of SSTI, recommending that cellulitis be treated with a 5-day course of antibiotics. These guidelines also recommend that most other pediatric SSTIs can be treated with a 5-7-day course of antibiotics. This CM Clinical Practice Guideline (CPG) serves as a resource and decision support tool for clinicians, encouraging the use of evidence-based SSTI treatment.

**Definition** Skin and soft tissue infections (SSTIs) are clinical entities of variable presentation, etiology, and severity that involve microbial invasion of the layers of the skin and underlying soft tissues (Ki et al., 2008).

#### **Objective of Clinical Practice Guideline**

- Standardized treatment and appropriate antibiotic selection and duration

#### **Target Users**

- Primary Care Clinicians
- Urgent Care
- Emergency Medicine
- Hospital Medicine
- Infectious Disease

#### **Target Population**

##### **Guideline Inclusion Criteria**

Patients >60 days with suspected skin and soft tissue infection

##### **Guideline Exclusion Criteria**

- Less than 60 days of age
- Suspected sepsis
- Animal or human bites
- Surgical site infections
- Suspected toxin-mediated reaction
- Immunocompromised, including steroid use >14 days
- Growth of multi-drug resistant organism in the past
- Deeper infections (Myositis, Fasciitis)
- Necrotizing infections
- SSTI infection of face, tooth, eye, perineum, operative sites

*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

The Infectious Diseases Society of America guideline provided guidance to the SSTI CPG committee (Stevens et al., 2014). See Table 1 for AGREE II.

Table 1.  
AGREE II<sup>a</sup> Summary for the Guideline Stevens et al. (2014)

Domain	Percent Agreement	Percent Justification
Scope and purpose	99%	The aim of the guideline, the clinical questions posed and target populations were identified.
Stakeholder involvement	58%	The guideline did not include appropriate stakeholders (such as patients, nurses, parents, pharmacists) nor the viewpoints of the intended user.
Rigor of development	81%	The process used to gather and synthesize the evidence, the methods to formulate the recommendations and to update the guidelines were explicitly stated.
Clarity and presentation	100%	The guideline recommendations are clear, unambiguous, and easily identified; in addition, different management options are presented.
Applicability	52%	The guideline did not address implementation barriers and facilitators, utilization strategies, or resource costs associated implementation.
Editorial independence	100%	The recommendations were not biased with competing interests.
Committee's recommendation for guideline use	Yes with modifications	IDSA is used for diagnosis, evaluation, and treatment recommendations. An additional question was posed by the CPG committee.

Note: Four EBP Scholars completed the AGREE II (Brouwers et al., 2010) on this guideline.

**Additional Question Posed by the CPG Committee (Appendix A)**

- [1. In pediatric patients with suspected Skin and Soft Tissue Infection \(SSTI\), should antibiotics be prescribed after the abscess is drained versus no antibiotics for the outcomes of cured at follow-up and rate of recurrence?](#)

**Question Recommendation** A conditional recommendation is made for the use of antibiotics for abscesses, based on the GRADE Evidence to Decision instrument the Summary of Findings Table. The overall certainty in the evidence is low to very low. In pediatric patients, the use of antibiotics following incision and drainage was favorable for cure rate versus placebo. There is little evidence for or against antibiotics following incision and drainage for abscesses.

\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

**Practice Recommendations**

Please refer to The Infectious Diseases Society of America Clinical Practice Guideline for full diagnosis, evaluation, and treatment recommendations (Stevens et al., 2014).

**Children's Mercy Practice Recommendations and Reasoning**

Children's Mercy adopted the majority of the practice recommendations made by the IDSA Clinical Practice Guideline. Deviations include:

The IDSA (Stevens et al., 2014) states "the addition of systemic antibiotics to incision and drainage of cutaneous abscesses does not improve cure rates, even in those due to MRSA, but did have a modest effect on the time to recurrence of other abscesses. However, systemic antibiotics should be given to patients with severely impaired host defenses or signs or symptoms of systemic infection. In addition, multiple abscesses, extremes of age, and lack of response to incision and drainage alone are additional settings in which systemic antimicrobial therapy should be considered (Stevens et al. 2014, pg. e22)." Based on a current review of literature, Children's Mercy makes a conditional recommendation for the use of antibiotics for abscesses after incision and drainage. The overall certainty in the evidence is low to very low. In pediatric patients, the use of antibiotics following incision and drainage was favorable for cure rate versus placebo. There is little evidence for or against antibiotics following incision and drainage for abscesses <2cm. ([Supporting Evidence](#))

**Outcome Measures**

- Increase percentage of patients receiving 5-7 days of antibiotics by 20%

**Process Measures**

- Use of updated prescription folder within the electronic medical record  
Review of CPG

**Balance Measures**

- Return within 14 days with same diagnosis

**Other Potential Outcomes**

- Reducing risk of side effects or adverse events from medication
- Reducing risk of antimicrobial resistance
- Reducing healthcare cost (small)

**Potential Organizational Barriers**

- Provider resistance to practice change
- Provider concern for treatment failure with shorter antibiotic course

**Order Sets(s) (Appendix B)****Guideline Preparation**

This guideline was prepared by the Evidence Based Practice (EBP) Department in collaboration with content experts at Children's Mercy Kansas City. The development of this guideline supports the Service and Performance Excellence initiative to promote care standardization that builds a culture of quality and safety that is evidenced by measured outcomes. If a conflict of interest is identified the conflict will be disclosed next to the Committee member's name.

**Implementation & Follow-up**

- Once approved, the guideline was presented to appropriate care teams and implemented
- Care measurements will be assessed and shared with appropriate care teams to determine if changes need to occur
- Creation of an algorithm to provide evidence-based and consistent care throughout CM
- Creation of a standardized order set (Power Plan) consistent with the algorithm to provide additional decision support and decrease the risk of ordering error
- Education of providers in Urgent Care, Emergency Medicine, and Pediatric Hospital Medicine
- This guideline is scheduled for revision on May 2025

*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

**Conflict of Interests (COI)**

- No COIs were reported for this CPG

**Committee Members and Representation**

- Megan Hamner, MD | Infectious Diseases | Committee Chair
- Rana El Feghaly, MD, MSCI | Infectious Diseases | Committee Member
- Erin Scott, DO | Emergency Medicine | Committee Member
- Jessica Markham, MD, MSc | Hospital Medicine | Committee Member
- Amanda Nedved, MD | Urgent Care | Committee Member

**Patient and Family Representation**

**MIT Committee Members**

- Tracy Taylor | Medical Informatics | Committee Member
- George Abraham, MD | Medical Informatics | Committee Members
- Amber Lanning | Medical Informatics | Committee Members
- Brandan Kennedy, MD | Medical Informatics | Committee Members

**EBP Committee Members**

- Katie Berg, MD, FAAP | Evidence Based Practice & Hospital Medicine | Committee member
- Jarrod Dusin, MS, RD, LD, CPHQ | Evidence Based Practice | Committee member

**Guideline Development Funding**

The development of this guideline was underwritten by the Department of EBP and the divisions of Hospital Medicine, Emergency Medicine, Infectious Diseases, and Urgent Care.

**Approval Process**

This guideline was reviewed and approved by external and internal experts, internally by Hospital Medicine, Emergency Medicine, Infectious Diseases, Urgent Care, Content Expert Committee, the EBP Department, and other appropriate hospital committees deemed suitable for this guideline’s intended use. Guidelines are reviewed and updated as necessary every 3 years within the EBP Department at CMKC. Content expert committees will be involved with every review and update.

**Approval Obtained**

Department/Unit	Date Approved
Hospital Medicine	January 2022
Emergency Medicine	January 2022
Infectious Diseases	January 2022
Urgent Care	January 2022
Medical Executive	April 2022

**Version History**

Date	Comments
5/13/2022	Version 1

**Disclaimer**

When evidence is lacking or inconclusive, options in care are provided in the guideline and the order sets that accompany the guideline.

These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time.

It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be require

*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

**Specific Care Question:** In pediatric patients with suspected Skin and Soft Tissue Infection (SSTI), should antibiotics be prescribed after the abscess is drained versus no antibiotics for the outcomes of cured at follow-up and rate of recurrence?

**Recommendations from the Skin and Soft Tissue Infection CPG Team** *A conditional recommendation is made for the use of antibiotics for abscesses, based on the GRADE Evidence to Decision instrument the Summary of Findings Table. The overall certainty in the evidence is low to very low. In pediatric patients, the use of antibiotics **following incision and drainage** was favorable for cure rate versus placebo. There is little evidence for or against antibiotics **following incision and drainage** for abscesses <2cm. (see Summary by Outcome for substantiation of recommendations).*

The SSTI CPG Subcommittee discussed additional considerations using the GRADE Evidence to Decision instrument<sup>a</sup> found in the appendix to recommend antibiotic therapy for abscess following incision and drainage at Children's Mercy based on feasibility, value, and compliance for all stakeholders.

### Literature Summary

#### Background

Skin and soft tissue infection is a common presentation in pediatric emergency departments and ambulatory settings, of which almost half are abscesses (Gottlieb & Peksa, 2018; Taira et al., 2009). Standard clinical treatment for abscesses includes incision and drainage, but the utility of antibiotics for simple abscesses remains unclear (Singer & Talan, 2014). The Infectious Diseases Society of America recommends that incision and drainage is likely adequate for simple abscess (Stevens et al., 2014). A recent meta-analysis (Gottlieb & Peksa, 2018) of adults and pediatric patients found that systemic antibiotics for abscesses after incision and drainage increased clinical cure rates. This contrasts with a previous meta-analysis (Fahimi et al., 2015) of adults and pediatric patients that found no improvement in clinical cure rate. This review will summarize identified literature of pediatric patients to answer the specific care question on the topic.

**Study characteristics.** The search for suitable studies was completed on August 31, 2021. A. Nedved, MD and E. Scott, DO reviewed the 147 titles and/or abstracts found in the search and identified<sup>b</sup> one guideline and six single studies believed to answer the question. After an in-depth review of the guideline<sup>d</sup> and the single studies<sup>c</sup>, four answered the question(s). Two systematic reviews (SR) (Fahimi et al., 2015; Gottlieb et al., 2019) were identified in the search. Both SRs included both adults and pediatric patients. Only the pediatric studies from the SRs were included in the current review.

### Summary by Outcome

#### Cure Rate 7-10 days for Children, Trimethoprim / Sulfamethoxazole (TMP-SMX) versus Placebo

Two studies (Daum et al., 2017; Duong et al., 2010) measured cure rate at 7-10 days, ( $n = 329$ ). For the outcome of cure rate at 7–10 days, the  $OR = 1.97$ , 95% CI [1.04, 3.73],  $p = .04$ , indicated the intervention of TMP-SMX was favorable to the comparator of placebo (see Figure 3 & Table 2). The use of TMP-SMX would result in a cure rate of 6 to 133 more patients per 1000.

**Certainty Of The Evidence For Cure Rate at 7-10 days for Children.** The certainty of the body of evidence was low. The body of evidence was assessed to have no serious inconsistency, no serious indirectness, but was assessed to have serious risk of bias and serious imprecision. Risk of bias was serious as Duong et al. (2010) did not reach power and medication compliance was only 66%. Imprecision was serious due to the low number of events and participants ( $n = 329$ ).

\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times. 8

**Cure Rate 7-14 days for Children and Adults, TMP-SMX versus Placebo**

Three studies (Daum et al., 2017; Duong et al., 2010; Talan et al., 2016) measured cure rate at 7-14 days, ( $n = 1576$ ). For the outcome of cure rate at 7–14 days, the  $OR = 1.55$ , 95% CI [1.22, 1.97],  $p = .0005$ , indicated the intervention of TMP-SMX was favorable to the comparator of placebo (see Figure 3 & Table 2). The use of TMP-SMX would result in a cure rate of 34 to 105 more patients per 1000.

**Certainty Of The Evidence For Cure Rate at 7-14 days for Children and Adults.** The certainty of the body of evidence was low. The body of evidence was assessed to have no serious inconsistency and no serious imprecision, but was assessed to have serious risk of bias and serious indirectness. Risk of bias was serious due to potential selection bias (Talan et al., 2016). This study made up 86% of the final weight of the meta-analysis results. Indirectness was serious due to Talan et al. (2016) included both adults and children.

**Recurrence at 3 months for Children, TMP-SMX versus Placebo for Children**

One studies (Duong et al., 2010) measured recurrence at 3 months, ( $n = 98$ ). For the outcome of recurrence at 3 months, the  $OR = 0.97$ , 95% CI [0.40, 2.34],  $p = .95$ , indicated the intervention of TMP-SMX was no different to the comparator of placebo (see Figure 5 & Table 2).

**Certainty Of The Evidence For Cure Rate at 7-10 days for Children.** The certainty of the body of evidence was. The body of evidence was assessed to have no serious inconsistency, no serious indirectness, but was assessed to have serious risk of bias and serious imprecision. Risk of bias was serious due to Duong et al. (2010) not recruit enough study participants to detect significance and the medication compliance of the subjects was only 66%. Imprecision was serious due to the low number of events and participants ( $n = 98$ ).

**Adverse Events for Children, TMP-SMX versus Placebo**

Two studies (Daum et al., 2017; Duong et al., 2010) measured adverse events, ( $n = 672$ ). For the outcome of adverse events, the  $OR = 0.73$ , 95% CI [0.47, 1.15],  $p = .18$ , indicated the intervention of TMP-SMX was no different to the comparator of placebo (see Figure 4 & Table 2).

**Certainty Of The Evidence For Adverse Events for Children.** The certainty of the body of evidence was. The body of evidence was assessed to have no serious inconsistency, no serious indirectness, but was assessed to have serious risk of bias and serious imprecision. Risk of bias was serious due to Duong et al. (2010) not recruit enough study participants to detect significance and the medication compliance of the subjects was only 66%. Imprecision was serious due to the low number of events ( $n = 186$ ).

**Adverse Events for Children and Adults, TMP-SMX versus Placebo**

Three studies (Daum et al., 2017; Duong et al., 2010; Talan et al., 2016) measured cure rate at 7-14 days, ( $n = 1709$ ). For the outcome of adverse events, the  $OR = 0.89$ , 95% CI [0.59, 1.35],  $p = .59$ , indicated the intervention of TMP-SMX was no different to the comparator of placebo (see Figure 4 & Table 2).

**Certainty Of The Evidence For Adverse Events for Children and Adults.** The certainty of the body of evidence was very. The body of evidence was assessed to have no serious imprecision, but was assessed to have serious risk of bias, serious inconsistency, and serious indirectness. Risk of bias was serious due to potential selection bias of (Talan et al., 2016). This study made up 86% of the final weight of the meta-analysis results. Inconsistency was serious due to each study measuring adverse events differently and moderate heterogeneity based on  $I^2$  of 77%. Indirectness was judged to be serious due to the inclusion of both adults and children (Talan et al. (2016).

**Cure Rate 7-10 days for Children, Clindamycin versus Placebo**

One study (Daum et al., 2017) measured cure rate at 7-10 days, ( $n = 190$ ). For the outcome of cure rate at 7–10 days, the  $OR = 1.97$ , 95% CI [1.04, 3.73],  $p = .04$ , indicated the intervention of clindamycin was favorable to the comparator of placebo (see Figure 6 & Table 3). The use of clindamycin would result in a cure rate of 106 to 261 more patients per 1000.

**Certainty Of The Evidence For Cure Rate at 7-10 days for Children.** The certainty of the body of evidence was low. The body of evidence was assessed to not have serious risk of bias, nor serious inconsistency, or serious indirectness, but very serious imprecision. Imprecision was very serious due to the low number of events and participants ( $n = 190$ ).

**Adverse Events for Children, Clindamycin versus Placebo**

One study (Daum et al., 2017) measured adverse events, ( $n = 190$ ). For the outcome of adverse events, the  $OR = 3.76$ , 95% CI [1.74, 8.11],  $p = .005$ , indicated the intervention of clindamycin was not favorable to the placebo comparator (see Figure 7 & Table 3). The use of clindamycin would result in a 23 to 184 more adverse events per 1000 patients.

**Certainty Of The Evidence For Cure Rate at 7-10 days for Children.** The certainty of the body of evidence was. The body of evidence was assessed to not have serious risk of bias, nor serious inconsistency, or serious indirectness, but had very serious imprecision. Imprecision was very serious due low number of events and participants ( $n = 190$ ).

**Recurrence at 1 year for Children, Antibiotics versus No-antibiotics**

One study (Hogan et al., 2018) measured recurrence at 1 year, ( $n = 383$ ). For the outcome of recurrence at 1 year, the  $OR = 0.37$ , 95% CI [0.17, 0.84],  $p = .02$ , indicated the intervention of antibiotics (clindamycin, TMP-SMX, vancomycin) was favorable to the comparator of no-antibiotics (see Figure 8 & Table 4).

**Certainty Of The Evidence For Recurrence at 1 year for Children.**

The certainty of the body of evidence was low. The body of evidence was assessed to have no serious inconsistency and no serious indirectness, but was assessed to have serious imprecision and serious risk of bias. Risk of bias was serious due to the low number of participants in the comparison group. Imprecision was serious due to the low number of events ( $n = 90$ ).

**Methods Used for Appraisal and Synthesis**

<sup>a</sup>The GRADEpro Guideline Development Tool (GDT) is the tool used to create the Summary of Findings (SOF) table(s) for this analysis. Using the GDT, the author of this CAT rates the certainty of the evidence based on four factors: *within-study risk of bias, consistency among studies, directness of evidence, and precision of effect estimates*. Each factor is subjectively judged against the author’s confidence of the estimated treatment effect. Confidence is assessed as not serious, serious or very serious. If the attribute of serious or very serious is assessed, the author will provide an explanation.

<sup>b</sup>Rayyan is a web-based software used for the initial screening of titles and / or abstracts for this analysis (Ouzzani, Hammady, Fedorowicz & Elmagarmid, 2017).

<sup>c</sup>Review Manager (Higgins & Green, 2011) is a Cochrane Collaborative computer program used to assess the study characteristics as well as the risk of bias and create the forest plots found in this analysis.

<sup>d</sup>The Appraisal of Guidelines Research and Evaluation II (AGREE II) is an international instrument used to assess the quality and reporting of clinical practice guidelines for this analysis (Brouwers et al. 2010).

<sup>e</sup>The Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) flow diagram depicts the process in which literature is searched, screened, and eligibility criteria is applied (Moher, Liberati, Tetzlaff, & Altman, 2009).

Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA)<sup>c</sup>

\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

**Figure 2**  
*Risk of Bias Summary*

	Random sequence generation (selection bias)	Allocation concealment (selection bias)	Blinding of participants and personnel (performance bias)	Blinding of outcome assessment (detection bias)	Incomplete outcome data (attrition bias)	Selective reporting (reporting bias)	Other bias
Daum 2017	+	+	+	?	+	+	+
Doung 2010	+	?	+	+	-	+	-
Talan 2016	+	+	+	+	+	+	?

\*These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved 14 in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

Summary of Findings Table(s)

Table 2

**Summary of Findings Table<sup>a</sup>: TMP-SMX compared to Placebo**

Certainty assessment							Summary of findings				
Participant s (studies) Follow-up	Risk of bias	Inconsistenc y	Indirectnes s	Imprecisio n	Publicatio n bias	Overall certaint y of evidenc e	Study event rates (%)		Relativ e effect (95% CI)	Anticipated absolute effects	
							With Placeb o	With TMP- SMX		Risk with Placeb o	Risk differenc e with TMP-SMX
<b>Cure Rate 7-14 days Children and Adults</b>											
1576 (3 RCTs)	serious <sup>a</sup> , b	not serious	serious <sup>c</sup>	not serious	none	⊕⊕○○ Low	587/78 2 (75.1% )	652/79 4 (82.1% )	<b>OR 1.55</b> (1.21 to 1.97)	751 per 1,000	<b>73 more per 1,000</b> (from 34 more to 105 more)
<b>Cure Rate 7-10 days Children</b>											
329 (2 RCTs)	serious <sup>b</sup>	not serious	not serious	serious <sup>d</sup>	none	⊕⊕○○ Low	133/16 5 (80.6% )	145/16 4 (88.4% )	<b>OR 1.97</b> (1.04 to 3.73)	806 per 1,000	<b>85 more per 1,000</b> (from 6 more to 133 more)
<b>Adverse Events Adults and Children</b>											
1709 (3 RCTs)	serious <sup>a</sup> , b	serious <sup>e</sup>	serious <sup>c</sup>	not serious	none	⊕○○○ Very low	102/83 7 (12.2% )	98/872 (11.2% )	<b>OR 0.89</b> (0.59 to 1.35)	122 per 1,000	<b>12 fewer per 1,000</b> (from 46 fewer to 36 more)
<b>Adverse Events Children</b>											

*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved 15 in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

Certainty assessment							Summary of findings				
672 (2 RCTs)	serious <sup>b</sup>	not serious	not serious	serious <sup>d</sup>	none	⊕⊕○○ Low	99/333 (29.7%) )	88/339 (26.0%) )	<b>OR</b> <b>0.73</b> (0.47 to 1.15)	297 per 1,000	<b>61 fewer per 1,000</b> (from 131 fewer to 30 more)
<b>Recurrence 3 months Children</b>											
98 (1 RCT)	serious <sup>f</sup>	not serious	not serious	serious <sup>d</sup>	none	⊕⊕○○ Low	15/52 (28.8%) )	13/46 (28.3%) )	<b>OR</b> <b>0.97</b> (0.40 to 2.34)	288 per 1,000	<b>6 fewer per 1,000</b> (from 149 fewer to 198 more)

*Explanations*

- a. Potential selection bias due to physicians ability to exclude patients at higher risk (Talan et al., 2016). Talan et al. (2016) study has 86% weight in meta-analysis.
- b. Duong et al. (2010) not recruit enough study participants to detect significance and the medication compliance of the subjects was only 66%.
- c. One study (Talan et al., 2016) included both adults and children.
- d. Low number of events and subjects.
- e. Adverse events measured differently in each study.
- f. Study did not reach power and only a medication compliance rate of 66% (Duong et al., 2010).

*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

**Table 3**  
**Summary of Findings Table: Clindamycin compared to Placebo**

Certainty assessment							Summary of findings				
Participants (studies) Follow-up	Risk of bias	Inconsistency	Indirectness	Imprecision	Publication bias	Overall certainty of evidence	Study event rates (%)		Relative effect (95% CI)	Anticipated absolute effects	
							With Placebo	With Clindamycin		Risk with Placebo	Risk difference with Clindamycin
<b>Cure Rate 7-10 days</b>											
190 (1 RCT)	not serious	not serious	not serious	very serious <sup>a</sup>	none	⊕⊕○○ Low	61/89 (68.5%)	90/101 (89.1%)	<b>OR 3.76</b> (1.74 to 8.11)	685 per 1,000	<b>206 more per 1,000</b> (from 106 more to 261 more)
<b>Adverse Events</b>											
523 (1 RCT)	not serious	not serious	serious <sup>b</sup>	very serious <sup>a</sup>	none	⊕○○○ Very low	32/257 (12.5%)	58/266 (21.8%)	<b>OR 1.96</b> (1.22 to 3.14)	125 per 1,000	<b>93 more per 1,000</b> (from 23 more to 184 more)

*Explanations*

- a. Low number of events and participants
- b. Includes children and adults

*\*These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. <p><b>Interventions</b></p>	<p><b>Both:</b> After incision and drainage of the abscess and determination of the size of the abscess, participants were randomly assigned in a 1:1:1 ratio to receive placebo, clindamycin, or TMP-SMX. Participants were seen at the end of</p>																				

\*These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

	<p>treatment (day 12), at the test-of-cure visit (7 to 10 days after the prescribed 10-day course of therapy), and at the 1-month follow-up (day 40).</p> <ul style="list-style-type: none"> <li>• <b>Group 1:</b> Clindamycin was given as two 150-mg tablets three times daily</li> <li>• <b>Group 2:</b> TMP-SMX was given as two tablets (containing 80mg of trimethoprim and 400 mg of sulfamethoxazole) twice daily plus one dose of placebo pills</li> <li>• <b>Group 3:</b> Two placebo pills given three times daily</li> </ul>	
<b>Outcomes</b>	<p><b>Primary outcome(s):</b></p> <ul style="list-style-type: none"> <li>• Clinical cure by day 7 to 10 days*</li> </ul> <p><b>Secondary outcome(s)</b></p> <ul style="list-style-type: none"> <li>• Clinical cure at day 40*</li> </ul> <p><b>Safety outcome(s):</b></p> <ul style="list-style-type: none"> <li>• Adverse events*</li> </ul> <p>*Outcomes of interest to the CMH CPG or CAT development team</p>	
<b>Notes</b>	<ul style="list-style-type: none"> <li>• Ten days after therapy in the intention-to-treat population, the cure rate: <ul style="list-style-type: none"> <li>○ Clindamycin: 221 of 266 participants [83.1%]</li> <li>○ TMP-SMX: 215 of 263 participants [81.7%]</li> <li>○ Placebo: 177 of 257 participants [68.9%], <math>p &lt; .001</math> for both comparisons</li> </ul> </li> <li>• New infections at 1 month of follow-up <ul style="list-style-type: none"> <li>○ Clindamycin: 15 of 221, 6.8%</li> <li>○ TMP-SMX: 29 of 215, 13.5%, <math>p = .03</math></li> <li>○ Placebo: 22 of 177, 12.4%, <math>p = .06</math></li> </ul> </li> <li>• Adverse events <ul style="list-style-type: none"> <li>○ Clindamycin: 58 of 265, 21.9%</li> <li>○ TMP-SMX: 29 of 261, 11.1%</li> <li>○ Placebo 32 of 255, 12.5%</li> </ul> </li> </ul>	
<b>Risk of bias</b>		
<b>Bias</b>	<b>Judgment</b>	<b>Support for judgment</b>
Random sequence generation (selection bias)	Low risk	Variable-block randomization
Allocation concealment (selection bias)	Low risk	Allocation determined by independent statistics and data-coordinating center
Blinding of participants and personnel (performance bias)	Low risk	Participants and all study staff were unaware of the study-group assignments

\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

Blinding of outcome assessment (detection bias)	Unclear risk	Staff assessing outcomes were unaware of study groups
Incomplete outcome data (attrition bias)	Low risk	Intention-to-Treat was used for primary outcome
Selective reporting (reporting bias)	Low risk	All outcomes reported
Other bias	Low risk	

*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved 28 in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

<p><b>Interventions</b></p>	<p><b>Both:</b></p> <ul style="list-style-type: none"> <li>• Ultrasonography was available, measurements were made in 2 dimensions, diameter and depth. Local anesthetic or procedural sedation was used at the discretion of the attending physician</li> <li>• The skin overlying all skin abscesses was cleansed with 10% povidone iodine solution and then incised with a no. 11 blade, probed for loculations, and irrigated with normal saline solution.</li> <li>• Abscess cultures obtained immediately after surgical incision and sent for culture and antibiotic sensitivity testing. <ul style="list-style-type: none"> <li>▪ <b>Group 1:</b> TMP-SMX dose for mild bacterial infections (10-12 mg trimethoprim/kg/ day divided into 2 doses, with a maximum dose of 160 mg trimethoprim/dose).</li> <li>▪ <b>Group 2:</b> The placebo consisted of a Maalox and tonic water combination that resembled the antibiotic in color, texture, and taste.</li> </ul> </li> </ul>	
<p><b>Outcomes</b></p>	<p><b>Primary outcome(s):</b></p> <ul style="list-style-type: none"> <li>• Clinical resolution or failure at 10 days*</li> </ul> <p><b>Secondary outcome(s)</b></p> <ul style="list-style-type: none"> <li>• New Lesions on day 10</li> <li>• New lesions on day 3-months</li> </ul> <p><b>Safety outcome(s):</b></p> <ul style="list-style-type: none"> <li>• Adverse events*</li> </ul> <p>*Outcomes of interest to the CMH CPG or CAT development team</p>	
<p><b>Notes</b></p>	<ul style="list-style-type: none"> <li>• The failure rates were 5.3% (<math>n = 4/76</math>) and 4.1% (<math>n = 3/73</math>) in the placebo and antibiotic groups, respectively, yielding a difference of 1.2.</li> <li>• New lesions occurred at the 10-day follow-up: 19 on placebo (26.4%) and 9 on antibiotics (12.9%), yielding a difference of 13.5.</li> <li>• At the 3-month follow-up, 15 of 52 (28.8%) in the placebo group and 13 of 46 (28.3%) in the antibiotic group developed new lesions. The difference was 0.5%.</li> </ul>	
<p><b>Risk of bias</b></p>		
<p><b>Bias</b></p>	<p><b>Judgment</b></p>	<p><b>Support for judgment</b></p>
<p>Random sequence generation (selection bias)</p>	<p>Low risk</p>	<p>Computer randomization program</p>
<p>Allocation concealment (selection bias)</p>	<p>Unclear risk</p>	<p>Not discussed</p>
<p>Blinding of participants and personnel (performance bias)</p>	<p>Low risk</p>	<p>Participants and personal blinded</p>

\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

Blinding of outcome assessment (detection bias)	Low risk	The patient, parents, and clinician who assessed the clinical outcome were blinded to group assignment
Incomplete outcome data (attrition bias)	High risk	Per-protocol and study did not meet power
Selective reporting (reporting bias)	Low risk	All outcomes reported
Other bias	High risk	Low compliance rate of medications of 66%

*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved 31 in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

	<p>acid deficiency; pregnant or lactating; trimethoprim-sulfamethoxazole treatment within 24 hours; concurrent treatment with topical or systemic antibiotic; or enrolled in the study within 12 weeks.</p> <p><b>Power Analysis:</b> Enrollment of 590 participants would provide a power of 90% to detect an absolute between-group difference of 7.5 percentage points, assuming a cure rate of 90%</p>	
<b>Interventions</b>	<p><b>Both:</b> Incision and drainage of abscess</p> <ul style="list-style-type: none"> <li>• <b>Group 1:</b> 7-day course of trimethoprim-sulfamethoxazole (four single-strength pills, each containing 80 mg of trimethoprim and 400 mg of sulfamethoxazole, twice daily)</li> <li>• <b>Group 2:</b> Placebo (four pills containing microcrystalline cellulose, twice daily).</li> </ul>	
<b>Outcomes</b>	<p><b>Primary outcome(s):</b></p> <ul style="list-style-type: none"> <li>• Clinical cure of abscess, assessed 7 to 14 days</li> </ul> <p><b>Secondary outcome(s)</b></p> <ul style="list-style-type: none"> <li>• Subsequent surgical drainage procedures</li> <li>• Skin infections at new sites</li> </ul> <p><b>Safety outcome(s):</b></p> <ul style="list-style-type: none"> <li>• Adverse events</li> </ul> <p>*Outcomes of interest to the CMH CPG or CAT development team</p>	
<b>Notes</b>		
<b>Risk of bias table</b>		
<b>Bias</b>	<b>Judgment</b>	<b>Support for judgment</b>
Random sequence generation (selection bias)	Low risk	Web-based randomization, assigned participants in a 1:1 ratio
Allocation concealment (selection bias)	Low risk	Drug package identical
Blinding of participants and personnel (performance bias)	Low risk	Participants and personnel blinded
Blinding of outcome assessment (detection bias)	Low risk	Outcome assessors blinded
Incomplete outcome data (attrition bias)	Low risk	Intention-to-treat, secondary outcome per-protocol

\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

Selective reporting (reporting bias)	Low risk	All outcomes reported
Other bias	Unclear risk	potential selection bias due to physicians' ability to exclude patients at higher risk.

*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved 36 in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

<p><b>Cost effectiveness</b></p>		

\*These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved 40 in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

Does the cost-effectiveness of the intervention favor the intervention or the comparison?		
<b>JUDGEMENT</b>	<b>RESEARCH EVIDENCE</b>	<b>ADDITIONAL CONSIDERATIONS</b>
<ul style="list-style-type: none"> <li><input type="radio"/> Favors the comparison</li> <li><input type="radio"/> Probably favors the comparison</li> <li><input type="radio"/> Does not favor either the intervention or the comparison</li> <li><input type="radio"/> Probably favors the intervention</li> <li><input checked="" type="radio"/> Favors the intervention</li> <li><input type="radio"/> Varies</li> <li><input type="radio"/> No included studies</li> </ul>	Cost favors the intervention	While cost is associated with the antibiotic prescription, it is negligible compared to the cost of treatment failure (repeat clinic or ED visit, readmission, and/or repeat incision and drainage).
<b>Equity</b> What would be the impact on health equity?		
<b>JUDGEMENT</b>	<b>RESEARCH EVIDENCE</b>	<b>ADDITIONAL CONSIDERATIONS</b>
<ul style="list-style-type: none"> <li><input type="radio"/> Reduced</li> <li><input type="radio"/> Probably reduced</li> <li><input type="radio"/> Probably no impact</li> <li><input type="radio"/> Probably increased</li> <li><input type="radio"/> Increased</li> <li><input checked="" type="radio"/> Varies</li> <li><input type="radio"/> Don't know</li> </ul>	The cost of medication without insurance could impact subgroup populations. Subgroups may have less reliable transportation to a pharmacy. Subgroups may also have language or literacy barriers that impact the efficacy of prescription instructions.	Please see standard costs above.
<b>Acceptability</b> Is the intervention acceptable to key stakeholders?		
<b>JUDGEMENT</b>	<b>RESEARCH EVIDENCE</b>	<b>ADDITIONAL CONSIDERATIONS</b>
<ul style="list-style-type: none"> <li><input type="radio"/> No</li> <li><input type="radio"/> Probably no</li> <li><input checked="" type="radio"/> Probably yes</li> <li><input type="radio"/> Yes</li> <li><input type="radio"/> Varies</li> <li><input type="radio"/> Don't know</li> </ul>	Families and clinicians are likely to accept the intervention.	
<b>Feasibility</b>		

\*These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved 41 in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

Is the intervention feasible to implement?		
<b>JUDGEMENT</b>	<b>RESEARCH EVIDENCE</b>	<b>ADDITIONAL CONSIDERATIONS</b>
<ul style="list-style-type: none"> <li><input type="radio"/> No</li> <li><input type="radio"/> Probably no</li> <li><input type="radio"/> Probably yes</li> <li><input checked="" type="radio"/> Yes</li> <li><input type="radio"/> Varies</li> <li><input type="radio"/> Don't know</li> </ul>	The intervention is feasible	

SUMMARY OF JUDGEMENTS

	JUDGEMENT						
PROBLEM	No	Probably no	Probably yes	<b>Yes</b>		Varies	Don't know
DESIRABLE EFFECTS	Trivial	Small	<b>Moderate</b>	Large		Varies	Don't know

CONCLUSIONS

**Recommendation**

\*These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved 43 in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.

*A conditional recommendation is made for the use of antibiotics for abscesses, based on the GRADE Evidence to Decision instrument the Summary of Findings Table. The overall certainty in the evidence is low to very low. In pediatric patients, the use of antibiotics **following incision and drainage** was favorable for cure rate versus placebo. There is little evidence for or against antibiotics **following incision and drainage** for abscesses **<2cm**. (see Summary by Outcome for substantiation of recommendations).*

The SSTI CPG Subcommittee discussed additional considerations using the GRADE Evidence to Decision instrument<sup>a</sup> found in the appendix to recommend antibiotic therapy for abscess following incision and drainage at Children's Mercy based on feasibility, value, and compliance for all stakeholders.

*\* These guidelines do not establish a standard of care to be followed in every case. It is recognized that each case is different, and those individuals involved 44 in providing health care are expected to use their judgment in determining what is in the best interests of the patient based on the circumstances existing at the time. It is impossible to anticipate all possible situations that may exist and to prepare guidelines for each. Accordingly, these guidelines should guide care with the understanding that departures from them may be required at times.*

### Appendix B

#### Order Set (Inpatient)

Skin & Soft Tissue Infection (cellulitis, impetigo, abscess) (Planned Pending)		
Admit/Transfer		
This Powerplan is intended for otherwise healthy patients >60 days of age with suspected skin or soft tissue infection.		
<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Admit or Refer to Observation
Vital Signs/Monitoring		
<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Vital signs <span style="float:right">▼ Select an order sentence</span>
<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Weight <span style="float:right">▼ q3day</span>
